SPIRITUAL AND ETHICAL ASPECTS OF SOCIAL NETWORKS IN THE FORMATION OF CIVIL ACTIVITY IN YOUTH

Muratov Xabibulla Abdukodirovich

Teacher at Karshi State University, Uzbekistan

ABSTRACT

Formation of democratic principles, increase of social and political activity of citizens, introduction of individual freedom, liberalization of political processes, improvement of the multiparty system on the basis of democratic norms, increase of activity of public and non-governmental organizations in the period of the goal of building civil society in our country, the tasks are intertwined with a civic culture that embodies universal values. If we recognize civil society as an opportunity to express a high civic culture, we understand that the spiritual maturity of citizens is a factor in a full understanding of democratic principles in such a society. With the further development of the human mind, the development of science and technology, the Internet has entered the ranks of the media in the XXI century. This means of communication, which covers the global information space, has both positive and negative aspects. While its positive side is the dissemination and exchange of information for people between the ages of 3 and 80, its negative side serves to spread various destructive ideas, terrorism, obscenity, religious extremism and fundamentalism. We can see this in the example of various advertisements, announcements and small messages. It would be wrong to say that a small frustration, which at first seemed insignificant to us, later became a global problem.

KEYWORDS:- Technology, IT park, internet, global, virtual, information, computer, system, social, network, international, artificial world.

INTRODUCTION

The 21st century is the century of information technology development. It is difficult to imagine today's development without the World Wide Web. It is known that the Internet is an international system that combines computer networks that allow the exchange of information and documents. The Internet has opened the door to a wide range of opportunities. Traveling through libraries around the world through a global network without leaving home, becoming a remote (virtual) student at a higher education institution on the other side of the globe, and even providing e-services (translating texts, making video and audio products, pagination of books, etc.) can be done by contract, earn money. So there are many positive aspects to the internet. Nowadays, computers and mobile phones connected to the Internet are available in almost every home. In addition, children can use the network in Internet cafes. Today, due to the rapid development of information technology and its introduction into all spheres of socio-economic life, computer literacy is one of the most pressing issues for all.

The youth of world are growing up in a world of computer games and social networking. It's a joy,

of course. But there has to be a norm. Children need to know that the virtual world is not the real world. Sometimes children have the opportunity to visit the network without adult supervision and permission. As children and teens surf the Internet, they may come across sites that are completely inaccessible to them. It's a joy, of course. But there has to be a norm. Children have to know that the virtual world is not the real world. Sometimes children have the opportunity to visit the network without adult supervision and permission. As children and teenagers surf the Internet, they may come across sites that are completely inaccessible to them.

Of course, such information is more appealing to curious children and adolescents. It is a well-known fact that the more children are not allowed to do something, the more interest they will have. When teens come across some sources of information about unhealthy lifestyles on the net, it is likely that they will be more interested and pay special attention to this information. For this reason, adults need to explain to them from the moment of birth that they cannot touch hot teapots, pots, knives, scissors and other sharp objects, and that information on the network is dangerous. Of course, it is important to keep in mind that Internet resources can not only have a negative but also a dangerous effect on the upbringing of modern teenagers, as they expand their knowledge and outlook. While parents have recently tried to prevent children from becoming addicted to computer games and becoming attached to them, the risk has now been compounded by the threat of social media. The interactions of children and teenagers in the courtyards and on the streets have now shifted from real life to social networks without borders. These conversations are more interesting for children because, first of all, they have the opportunity to make more "friends" online. When communicating online, children can show

that they are successful children. They present themselves in the role of others and give in to various false worlds. For shy and timid children, online communication probably has its benefits, and in time, in real life, it can be effective.

The Internet is a place to meet almost all interests. Sometimes you don't even have to search the web for some information, they can be easily accessed because they are available everywhere. Modern educators and psychologists have not yet come to a conclusion about how virtual communication affects a child's personal development. While some argue that this only creates negative traits, it negatively affects children's behavior, expression, and facial expressions in interpersonal relationships, while others see virtual communication as a very convenient and easy way of modern communication. When young people learn to communicate online, they need to be made aware that the network generally does not allow them to provide their personal information, home phone number, address, and personal information of parents and loved ones.

They should emphasize the risk of encountering malicious people among their virtual "friends" and the risk of meeting them in real life and having a heart-to-heart with strangers according to their trusting habits. Every teenager should know that such conversations are often very convenient for cybercriminals. Mass spam, pleading SMS messages, disbelief in advertisements about some dubious "Choices" - in general, can be connected to a computer without a chain, which can lead to a black spot all over your life it is necessary to inculcate in them not to be deceived by dangerous information.

On these days, some social networks have restrictions on the registration of children under the age of 13. Some computer operating systems also have a "parental" control, which allows children to limit the amount of time they use the

system. It does not allow the computer to exceed the set time and automatically shuts down. If you allow your child to buy a computer and use it to expand their knowledge, you need to keep in mind that you also have responsibilities. In some countries, children have their own networks, which include: audio games, cartoons, texts in capital letters and texts in a language that children can understand. These sites are accessible to adults. Explaining to children in such network resources that there are rules of discipline in the virtual world as well as in real life is the first task. It is not surprising that in some areas they are even more educated than adults. However, in order to avoid any danger, it is urgent for us adults to keep an eye on them and explain that the Internet is far from real life, and that many of its sources are untrue. is our task. Among the centuries-old methods of education of our people, there is a need to keep abreast of the daily life of children and what they are doing. These are the educational methods inherited from our ancestors that we must not forget at any time and use them properly.

But with the salient advantages, you must know some of the disadvantages as well. The weak culture of information consumption, especially among young people, and the lack of knowledge, skills and abilities to distinguish what is needed from the flow of various messages are causing some people to be influenced by malicious people and trends, to become addicted to the Internet. The fact that the People's Republic of China recognizes Internet addiction as a disease and has established special hospitals to treat it is proof of this.

The biggest problem that has arisen as a result of the global network is, of course, the disease of addiction. Young people spending a lot of time online has become a global problem. Today, the Internet is a magic hat for some young people, found by Hashimjon, the famous writer Khudoiberdi Tokhtaboyev's "Riding the Yellow Giant." In general, the most difficult part of Internet addiction is forgetting the real world, the duties and responsibilities of humanity. One must live in real life, work honestly, acquire knowledge, perform one's duties diligently, selflessly serve one's country, and benefit others. A person who spends a lot of time on the Internet is in a state of abstraction and entanglement. This will pave the way for him to be manipulated and zombied by "third forces" in the future. It is no coincidence that today's subversive groups use the Internet to influence the minds of young people.Another downside of the Internet is that people's selfishness, arrogance, and, in modern parlance, egocentrism are on the rise.

The real economic conveniences and opportunities that society has created for man, his legal rights, and the moral and spiritual environment in which he lives must be reconciled with the pursuit of free, progressive, and lofty ideals. According to our scientists, the approach of citizens to social reality on the basis of a new, independent and free thinking is high. At the same time, according to psychologists and sociologists, the development of the emerging civil society in many respects requires the correction of individual consciousness, character and worldview. Today's world is the largest generation in the history of the entire human race in terms of number of young people, as they number 2 billion people. Today, concepts such as internet culture, virtual culture, information culture, and data management culture have taken root in our lives. It is time for young people to correctly define their place in the world of the Internet and interact with users, to develop the skills of accurate analysis of information in the virtual world. From a pedagogical point of view, the network has the following dangerous effects:

• Connecting to the Internet is one of the negative influences of our time;

• Take reading and learning lightly. Not to

complete homework independently due to ready-made lesson plans on the Internet, easy finding of solutions to mathematical problems;

• the risk of adverse effects on physical development, such as the child having to sit in front of a monitor for long periods of time without being active, etc.

• To avoid these risks, the following recommendations should be considered:

• don't let your child get out of control when they try to use the network;

• Inculcate in your child the habits of protection from the dangers listed above;

• Explain that from the first steps of your child to the network, the Internet can encounter not only "good" but also "bad" information;

• Explain to your child the rules of registration when accessing the network, ie not to provide personal information;

• Explain the rules to keep in mind when saving a resource from the Internet;

• Remind your child to remember the same rules of discipline online as in real life;

• Make it a habit to monitor your child's interactions every day;

• Regularly develop your child and your computer literacy. Share your knowledge. Remember that Internet security also depends on your knowledge and skills.

Indeed, before solving the tasks before them, human beings must weigh everything on the scales of reason, anticipate the possible consequences of the practical steps they take. Education plays an important role in promoting civic culture. We must not forget that enlightenment is in the blood of our people, our nation. From ancient times the concept of "enlightened person" has a much broader meaning. According to the traditional Eastern view, enlightenment means not only knowledge and skills, but also deep spirituality and good morals. Our people think of such people as educated and mature people. That is why the whole essence of our national model of training is connected with our national history and life.

In our country, where the foundations of civil society are being formed, one of the most important tasks today is to increase the civic activism of our youth, to develop in them a sense of duty and responsibility to the nation, people and society, and to form in their minds . That is why today at all levels of the education system there are classes and training courses aimed at improving the intellectual potential of young people. Thus, modern IT parks have been created in Uzbekistan, which are unique, unique, based on our great history and traditions, and at the same time can meet the requirements of the modern world. IT is the shortest and most effective way to develop the economy and exports. IT Park is the locomotive of this industry. The perfection of the IT industry is human capital, and thanks to the people, Uzbekistan will become a technological state.

These efforts will bear fruit in the future, strengthening the skills to apply their knowledge in practice, as well as supporting young people who are active citizens in this regard. After all, the purpose of modern education is to give everyone the opportunity to acquire new knowledge necessary for their work and apply it in society. Therefore, educational and training work should be aimed at raising the level of intellectual consciousness and culture of the individual to the understanding of the most important principles that meet the interests of man, society and the state. In building a civil society, it is especially important to raise and improve civic awareness, culture, sense of belonging and responsibility at the current level

of demand. Of course, this is an important issue in the activities of young people, and we emphasize once again that we need to implement it effectively. In addition, there are now technical capabilities to protect children from the Internet, which have already shown their negative effects in a number of countries around the world - these are special programs that are precisely the negative effects, dirt, bad habits, prevents the opening of promotional sites, i.e. if a teenager even enters such information into a search engine, the search results will be ineffective.

In today's rapidly developing country, the Internet, along with creating many opportunities and conveniences for people, has a negative impact on the ideological and moral standards of the youth of our society. At the same time, the Internet has become a powerful weapon capable of disrupting the lives of young people. The more these industries have a place among young people, the greater their risk. Almost 60-70 percent of the younger generation has become captives of the global network. They were so connected to the Internet that they did not even notice that they were watching the morning with him. The Internet has changed the worldview of young people. Almost all the young people who are immersed in this world are losing their humanity, feelings of compassion and culture of behavior. For example, a child who keeps an eye on his phone on public transport forgets the rules of etiquette, and does not realize that he does not spend as much time with his relatives and parents on the Internet. The internet is also the biggest enemy of such youth time. We may be connected to this "artificial world", we are missing the most important periods of our lives,

we are missing something. One day we will realize how productive our day is if we do not use the Internet. Therefore, we must protect ourselves from the Internet without wasting our lives in its whirlpool. Every strong-willed young generation understands that time is their most valuable asset and knows very well who and what to spend it on. They will be immune to various Internet attacks. It is important not to use social networks at all, but to use them in moderation. It would be appropriate if they took the last place in our lives, not the first. Because it is up to each of us to spend the life given to us effectively.
